**Product Description:**

**UV Poxy** is a perfect high build crystal clear coating, or imbedding epoxy. **UV Poxy** is a high performance 100% solids two component crystal clear epoxy formulated for Table Tops, Bar Tops, Wood finishes, See-Through Encapsulations, Art work, and other applications requiring a crystal clear, strong, plastic coating. **UV Poxy** is specifically designed to resist yellowing caused by sunlight and other ultra violet light sources. **UV Poxy** has an easy to use 1 to 1 by volume mix ratio, wets out substrates well, maintains its integrity over sharp corners, it has excellent air release qualities, and a relatively fast set time which may be accelerated by mild heat to 160F.

---

**Key Features:**

- 100% Solids
- Crystal Clear, high build finish
- Self-Leveling, High Gloss
- Extremely Durable
- U.V. Resistant
- Excellent Air Release Qualities
- Excellent Color Stability
- Impact Resistant
- Improves Surface Appearance
- Tough Water Resistant Finish
- Eliminates Craters, Crawling and Fish Eyes
- Will not blush or sweat under high humidity
- Maintains integrity over sharp edges
- Wets out substrates well
- Will not yellow or distort with age.
- Scratch Resilient & Maintenance Free

---

**Recommended Uses:**

Bar Tops, Counter Tops, Table Tops, Imbedding, Art Work, Jewelry, Crafts, or other applications requiring a crystal clear see through plastic coating.
UVPOXY

Recommended Surfaces:
Wood, Metal, Concrete, Granite, Copper, Stainless Steel, Laminate, Formica, Bamboo, Leather, Ceramic, Fiberglass, Plastic, Artwork, Photos, Rocks, Sea Shells, Fabrics, Paper, Dried Plants and much more.

Application Instructions:
UV Poxy is perfect for arts and crafts and any place where a crystal clear, UV stable epoxy is required. It is also often used for imbedding, making countertops, table tops and jewelry.

Working Conditions: For best results UV Poxy must be used at temperatures from 70-80 degrees F. The room which you are working in should be clean, dry, dust and insect free. Settling dust can often cause blemishes on the glossy surface.

Mix Ratio: 1:1 by volume

Work Time: 20 minutes depending on ambient temperature

Cure Time: 48 hours depending on ambient temperature, humidity and thickness.

Set to Touch: 4-8 hours

Minimum Recoat Time: 4-8 hours

Maximum Recoat Time: 24 hours

Clean Up: De Natured Alcohol

Recommended Storage: 55 degrees F. through 85 degrees F. with tightly sealed lids.

Application Procedures:
UV Poxy should be applied in two stages. The first stage is referred to as the seal coat. The seal coat is brushed on in a thin layer and is used to seal any pores in the surface and prevents air bubbles from forming in the following flood coats. This stage is followed by the flood coat, which will flow and self-level, foam brushes or squeegees can be used to help spread UV Poxy. Flood coats are applied in 1/8" layers at a time, as many as desired can be applied, however one to three coats is average for most table or bar coatings.
**Minimum Recoat Time:** This is the amount of time after the epoxy is applied in a thin film that it will arrive at a gel state, still wet, but no longer a liquid. To recoat without sanding between coats you must reapply after this point but before the drying time has completed. Recoating can usually be done within 4 to 8 hours. If re-coated within this time period no sanding is necessary between layers.

**Imbedding Pictures:** Objects, such as pictures, maps etc. can be imbedded in **UV Poxy** during the pours. Most photo quality paper does not require any special preparation however sometimes thin paper objects must first be sealed. Use a solution of 4 parts white glue and 1 part water. This will prevent thin paper objects from becoming translucent, this may be done with a brush. Two coats of sealer is advised. Wait 4-8 hours before pouring **UV Poxy**.

**Imbedding Solid Objects:** (wood, rocks, shells, etc.) All porous materials should first have a seal coat of **UV Poxy** applied. This will prevent air bubbles from occurring in subsequent flood coats. Usually the objects can be set in place before sealing.

**Note:** If 24 hours elapsed from time of application/coating, then additional preparation is required. Lightly sand entire surface with 220 grit sand paper until a light powdery residue appears and gloss finish has been removed to provide a profile for optimum bonding. Remove all sanding dust and wipe down entire surface with de natured alcohol to remove contaminants. At this point the epoxy has reached about 90% of its cured hardness. **UV Poxy** still might remain a bit flexible at this point but will complete 100% curing over the following 2-3 days. If ambient temperature drops below 60 degrees, cure times can double from the times shown.

**Exterior Applications:** Please note that although this product has been UV stabilized and will resist yellowing better than other epoxies it is NOT 100% UV resistant. Continuous outdoor UV exposure over months or years will cause the finish to lose its gloss, cause gradual changes in color and possibly warp.

**UV Poxy** produces professional results when used correctly, so take your time and make yourself aware of these common problems often encountered by first time users.
1. Always make sure that your mixing container is clean and your measuring device is accurate, this product REQUIRES that you mix at a 1 to 1 ratio by weight or volume, any variances from this can cause the epoxy to stay soft and not fully cure.

2. **UV Poxy** requires a THOROUGH mixing, typically 4-5 minutes of solid mixing without excessive whipping of the mixture (whipping will put lots of air bubbles into the epoxy). Mixing one gallon at a time can require up to 6 to 7 minutes of mixing. Beginners should never attempt to mix more than one gallon total per batch, 1 quart per batch is suggested until you feel comfortable with how UV Poxy works.

3. After the two components are poured together and stirring begins the mixture will turn a cloudy white color, this represents areas in which **UV Poxy** has not fully combined. You must continue to mix until all signs of cloudiness and tiny white lines have completely disappeared.

4. Always scrape the sides of your mixing container and also the stick during those 4-5 minutes. If UNMIXED epoxy remains on the side of the container or the stick it will cause wet spots on your finished product. **Note:** While pouring your epoxy onto the surface NEVER scrape the container to remove every last drop, because no matter how thorough you mix there will always be an unmixed drop on the side of the container that will leave a wet spot.

---

**How much UVPOXY so I need?**

**UVPoxy** - A simple math equation will tell you how much epoxy you need when casting.

- There are 1600 mils in a gallon
- There are 1000 mils in an inch
- Multiply Length X Width = Total Square feet.
- Multiply Total Square Feet X desired mils thickness = Total Mils

Divide Total Mils by 1600 = TOTAL GALLONS OF **UVPoxy** NEEDED TO CAST
